the P/T ratio is related to other quantities, we turn to the question of whether we can use it to define when a measurement system is adequate. The general guideline found in various gauge R&R studies is that good measurement systems will have a P/T ratio that is less than 0.10, while merely adequate measurement systems will have a P/T ratio that is less than 0.30. P, NP, and NP-Completeness - Cumulative Distribution Function Suppose $p(x)$ is a density function for a quantity. The cumulative distribution function (cdf) for the quantity is defined as $F(x) = \int_{-\infty}^x p(t) dt$. Gives: $F(x)$ The proportion of population with value less than x . $F(x)$ The probability of having a value less than x .
Thu, 31 Dec 2015 23:57:00 GMT Probability and Cumulative Distribution Functions - where the size $P(t)$ is measured in grams and time t is measured in hours. How long will it take for the culture to double in size? The initial size is $P_0 = 100$ grams, so we want to know when the future value $P(t)$ at some time t will equal 200. Therefore, we need to solve the equation $P(t) = 200$ for time t , which leads to the exponential equation $200 = 100e^{0.15t}$.
